

ABSTRACT OF THE DISCLOSURE

A game equipment support structure comprises a base, a pole support, and a panel having a support fitting fixedly attached thereto. A first end of the pole support is releasably connectable to the base and a second end of the pole support is releasably connectable to the support fitting. The game equipment support structure is readily configurable between a first panel configuration and a second panel configuration. In the first panel configuration, the panel is oriented generally vertically and a game apparatus is detachably mounted to the panel. In the second panel configuration the panel is oriented generally horizontally to form a table.
